

# KG Splicing Tool

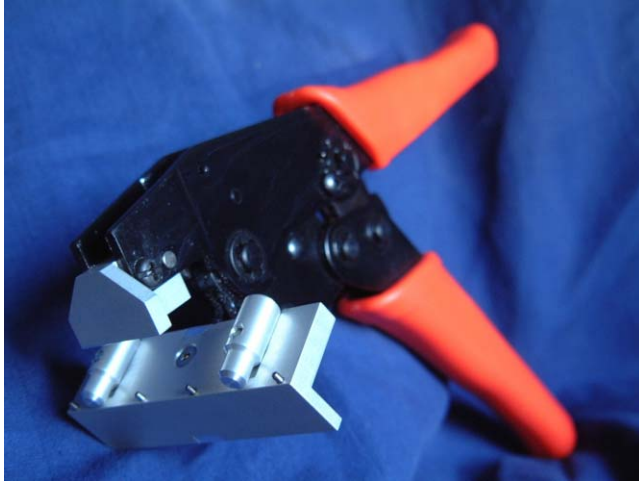

[www.benzltd.com](http://www.benzltd.com)

Are you familiar with having to feed follow-on SMD carrier tapes into feeders?  
Using short lengths of component tape in an automatic placement machine?  
Would you like to avoid machine stoppages?

## Here is how!

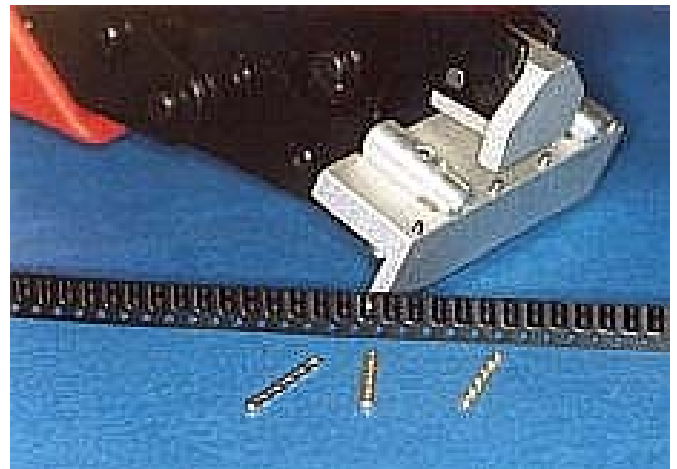

### The KG Splicing Tool

It ensures that SMD component tapes can be joined securely and quickly.

A special brass shim is riveted into the ends of the SMD tapes, thus joining them securely. Accurate alignment is achieved by first arranging the tapes by means of the locating pins of the KG Splicing Tool.

The cover tapes are joined, using pre-cut adhesive tapes, available in roll of 1000 and widths to suit different SMD tapes.

## The finished joint
